

## **LEARNING OBJECTIVES** from the AP® Biology Curriculum Framework\*

## **BIG IDEA 1:** The process of evolution drives the diversity and unity of life.

- LO 1.1 The student is able to convert a data set from a table of numbers that reflect a change in the genetic makeup of a population over time and to apply mathematical methods and conceptual understandings to investigate the cause(s) and effect(s) of this change. [See SP 1.5, 2.2]
- LO 1.2 The student is able to evaluate evidence provided by data to qualitatively and/or quantitatively investigate the role of natural selection in evolution. [See SP 2.2, 5.3]
- LO 1.3 The student is able to apply mathematical methods to data from a real or simulated population to predict what will happen to the population in the future. [See SP 2.2]
- LO 1.4 The student is able to evaluate data-based evidence that describes evolutionary changes in the genetic makeup of a population over time. [See SP 5.3]
- LO 1.5 The student is able to connect evolutionary changes in a population over time to a change in the environment. [See SP 7.1]
- LO 1.6 The student is able to use data from mathematical models based on the Hardy-Weinberg equilibrium to analyze genetic drift and effects of selection in the evolution of specific populations. [See SP 1.4, 2.1]
- LO 1.7 The student is able to justify the selection of data from mathematical models based on the Hardy-Weinberg equilibrium to analyze genetic drift and the effects of selection in the evolution of specific populations. [See SP 2.1, 4.1]
- LO 1.8 The student is able to make predictions about the effects of genetic drift, migration and artificial selection on the genetic makeup of a population. [See SP 6.4]
- LO 1.9 The student is able to evaluate evidence provided by data from many scientific disciplines that support biological evolution.

  [See SP 5.3]
- LO 1.10 The student is able to refine evidence based on data from many scientific disciplines that support biological evolution. [See SP 5.2]
- LO 1.11 The student is able to design a plan to answer scientific questions regarding how organisms have changed over time using information from morphology, biochemistry and geology. [See SP 4.2]
- LO 1.12 The student is able to connect scientific evidence from many scientific disciplines to support the modern concept of evolution. [See SP 7.1]
- LO 1.13 The student is able to construct and/or justify mathematical models, diagrams or simulations that represent processes of biological evolution. [See SP 1.1, 2.1]
- LO 1.14 The student is able to pose scientific questions that correctly identify essential properties of shared, core life processes that provide insights into the history of life on Earth. [See SP 3.1]

\*All Big Ideas, Essential Knowledge, Illustrative Examples, Learning Objectives (LO), and Science Practices (SP) are from the *AP® Biology Course and Exam Description, Revised Edition, Effective Fall 2015.* © 2015 The College Board. Reproduced with permission. apcentral.collegeboard.org.

- LO 1.15 The student is able to describe specific examples of conserved core biological processes and features shared by all domains or within one domain of life, and how these shared, conserved core processes and features support the concept of common ancestry for all organisms. [See SP 7.2]
- LO 1.16 The student is able to justify the scientific claim that organisms share many conserved core processes and features that evolved and are widely distributed among organisms today. [See SP 6.1]
- LO 1.17 The student is able to pose scientific questions about a group of organisms whose relatedness is described by a phylogenetic tree or cladogram in order to (1) identify shared characteristics, (2) make inferences about the evolutionary history of the group, and (3) identify character data that could extend or improve the phylogenetic tree. [See SP 3.1]
- LO 1.18 The student is able to evaluate evidence provided by a data set in conjunction with a phylogenetic tree or a simple cladogram to determine evolutionary history and speciation. [See SP 5.3]
- LO 1.19 The student is able create a phylogenetic tree or simple cladogram that correctly represents evolutionary history and speciation from a provided data set. [See SP 1.1]
- LO 1.20 The student is able to analyze data related to questions of speciation and extinction throughout the Earth's history. [See SP 5.1]
- LO 1.21 The student is able to design a plan for collecting data to investigate the scientific claim that speciation and extinction have occurred throughout the Earth's history. [See SP 4.2]
- LO 1.22 The student is able to use data from a real or simulated population(s), based on graphs or models of types of selection, to predict what will happen to the population in the future.

  [See SP 6.4]
- LO 1.23 The student is able to justify the selection of data that address questions related to reproductive isolation and speciation. [See SP 4.1]
- LO 1.24 The student is able to describe speciation in an isolated population and connect it to change in gene frequency, change in environment, natural selection and/or genetic drift. [See SP 7.2]
- LO 1.25 The student is able to describe a model that represents evolution within a population. [See SP 1.2]
- LO 1.26 The student is able to evaluate given data sets that illustrate evolution as an ongoing process. [See SP 5.3]
- LO 1.27 The student is able to describe a scientific hypothesis about the origin of life on Earth. [See SP 1.2]
- LO 1.28 The student is able to evaluate scientific questions based on hypotheses about the origin of life on Earth. [See SP 3.3]
- LO 1.29 The student is able to describe the reasons for revisions of scientific hypotheses of the origin of life on Earth. [See SP 6.3]
- LO 1.30 The student is able to evaluate scientific hypotheses about the origin of life on Earth. [See SP 6.5]
- LO 1.31 The student is able to evaluate the accuracy and legitimacy of data to answer scientific questions about the origin of life on Earth.

  [See SP 4.4]
- LO 1.32 The student is able to justify the selection of geological, physical, and chemical data that reveal early Earth conditions. [See SP 4.1]

| BIG IDEA 2: Biological systems utilize free energy and molecular building blocks to grow, to reproduce and to maintain dynamic homeostasis. |   |  |
|---|---|--|
| LO 2.1  | The student is able to explain how biological systems use free energy based on empirical data that all organisms require constant energy input to maintain organization, to grow, and to reproduce. [See SP 6.2]  |  |
| LO 2.2  | The student is able to justify a scientific claim that free energy is required for living systems to maintain organization, to grow, or to reproduce, but that multiple strategies for obtaining and using energy exist in different living systems. [See SP 6.1] |  |
| LO 2.3  | The student is able to predict how changes in free energy availability affect organisms, populations and/or ecosystems. [See SP 6.4]  |  |
| LO 2.4  | The student is able to use representations to pose scientific questions about what mechanisms and structural features allow organisms to capture, store and use free energy. [See SP 1.4, 3.1]  |  |
| LO 2.5  | The student is able to construct explanations of the mechanisms and structural features of cells that allow organisms to capture, store or use free energy. [See SP 6.2]  |  |
| LO 2.6  | The student is able to use calculated surface area-to-volume ratios to predict which cell(s) might eliminate wastes or procure nutrients faster by diffusion. [See SP 2.2]  |  |
| LO 2.7  | Students will be able to explain how cell size and shape affect the overall rate of nutrient intake and the rate of waste elimination.  |  |

| LO 2.19 | The student is able to make predictions about how positive feed-back mechanisms amplify activities and processes in organisms based on scientific theories and models. [See SP 6.4]   |
|---------|---|
| LO 2.20 | The student is able to justify that positive feedback mechanisms amplify responses in organisms. [See SP 6.1]   |
| LO 2.21 | The student is able to justify the selection of the kind of data needed to answer scientific questions about the relevant mechanism that organisms use to respond to changes in their external environment. [See SP 4.1]  |
| LO 2.22 | The student is able to refine scientific models and questions about the effect of complex biotic and abiotic interactions on all biological systems, from cells and organisms to populations, communities and ecosystems. [See SP 1.3, 3.2]                           |
| LO 2.23 | The student is able to design a plan for collecting data to show that all biological systems (cells, organisms, populations, communities and ecosystems) are affected by complex biotic and abiotic interactions. [See SP 4.2, 7.2]                                   |
| LO 2.24 | The student is able to analyze data to identify possible patterns and relationships between a biotic or abiotic factor and a biological system (cells, organisms, populations, communities or ecosystems). [See SP 5.1]   |
| LO 2.25 | The student can construct explanations based on scientific evidence that homeostatic mechanisms reflect continuity due to common ancestry and/or divergence due to adaptation in different environments. [See SP 6.2]   |
| LO 2.26 | The student is able to analyze data to identify phylogenetic patterns or relationships, showing that homeostatic mechanisms reflect both continuity due to common ancestry and change due to evolution in different environments. [See SP 5.1]                        |
| LO 2.27 | The student is able to connect differences in the environment with the evolution of homeostatic mechanisms. [See SP 7.1]  |
| LO 2.28 | The student is able to use representations or models to analyze quantitatively and qualitatively the effects of disruptions to dynamic homeostasis in biological systems. [See SP 1.4]  |
| LO 2.29 | The student can create representations and models to describe immune responses. [See SP 1.1, 1.2]   |
| LO 2.30 | The student can create representations or models to describe non-specific immune defenses in plants and animals. [See SP 1.1, 1.2]  |
| LO 2.31 | The student can connect concepts in and across domains to show that timing and coordination of specific events are necessary for normal development in an organism and that these events are regulated by multiple mechanisms. [See SP 7.2]                           |
| LO 2.32 | The student is able to use a graph or diagram to analyze situations or solve problems (quantitatively or qualitatively) that involve timing and coordination of events necessary for normal development in an organism. [See SP 1.4]                                  |
| LO 2.33 | The student is able to justify scientific claims with scientific evidence to show that timing and coordination of several events are necessary for normal development in an organism and that these events are regulated by multiple mechanisms. [See <b>SP 6.1</b> ] |

the maintenance of dynamic homeostasis. [See SP 7.1]

mechanisms. [See SP 5.3]

The student is able to evaluate data that show the effect(s) of

changes in concentrations of key molecules on negative feedback

LO 2.17

|  |  | _ |  |   |
|--|--|---|--|---|
| LO 2.36  | The student is able to justify scientific claims with evidence to show how timing and coordination of physiological events involve regulation. [See SP 6.1]  |   | LO 3.11  | The student is able to evaluate evidence provided by data sets to support the claim that heritable information is passed from one generation to another generation through mitosis, or meiosis followed by fertilization. [See SP 5.3]  |
| LO 2.37  | The student is able to connect concepts that describe mechanisms that regulate the timing and coordination of physiological events. [See SP 7.2]   |   | LO 3.12  | The student is able to construct a representation that connects the process of meiosis to the passage of traits from parent to offspring. [See SP 1.1, 7.2]   |
| LO 2.38  | The student is able to analyze data to support the claim that responses to information and communication of information affect natural selection. [See SP 5.1]   |   | LO 3.13  | The student is able to pose questions about ethical, social or medical issues surrounding human genetic disorders. [See SP 3.1]   |
| LO 2.39  | The student is able to justify scientific claims, using evidence, to describe how timing and coordination of behavioral events in organisms are regulated by several mechanisms. [See <b>SP 6.1</b> ]  |   | LO 3.14  | The student is able to apply mathematical routines to determine Mendelian patterns of inheritance provided by data sets. [See SP 2.2]   |
| LO 2.40  | predict how environmental factors affect responses to information  |   |  | The student is able to explain deviations from Mendel's model of the inheritance of traits. [See SP 6.2, 6.5]   |
| LO 2.41  | and change behavior. [See SP 7.2]  The student is able to evaluate data to show the relationship   |   | LO 3.16  | The student is able to explain how the inheritance patterns of many traits cannot be accounted for by Mendelian genetics. [See SP 6.3]  |
| LO 2.42  | between photosynthesis and respiration in the flow of free energy through a system. [See SP 5.3, 7.1]  The student is able to pose a scientific question concerning the  |   | LO 3.17  | The student is able to describe representations of an appropriate example of inheritance patterns that cannot be explained by Mendel's model of the inheritance of traits. [See SP 1.2]   |
|  | behavioral or physiological response of an organism to a change in its environment. [See SP 3.1]   |   | LO 3.18  | The student is able to describe the connection between the regulation of gene expression and observed differences between   |
| LO 2.43  | The student is able to connect the concept of cell communication to the functioning of the immune system. [See SP 7.2]   |   | LO 3.19  | different kinds of organisms. [See SP 7.1]  The student is able to describe the connection between the  |
|  |  | • |  | regulation of gene expression and observed differences between individuals in a population. [See <b>SP 7.1</b> ]  |
| BIG ID   | EA 3: Living systems store, retrieve, transmit and respond to information essential to life processes.   |   | LO 3.20  | The student is able to explain how the regulation of gene expression is essential for the processes and structures that support efficient cell function. | LO 3.32 | The student is able to generate scientific questions involving cell communication as it relates to the process of evolution. [See SP 3.1]  | BIG IE  | )EA 4:           | Biological systems interact, and these systems and their interactions possess complex properties.   |
|---------|--|---------|------------------|---|
| LO 3.33 | The student is able to use representation(s) and appropriate models to describe features of a cell signaling pathway. [See SP 1.4]   | LO 4.1  |                  | tudent is able to explain the connection between the sequence he subcomponents of a biological polymer and its properties.  |
| LO 3.34 | The student is able to construct explanations of cell communication through cell-to-cell direct contact or through chemical signaling. [See <b>SP 6.2</b> ]  | LO 4.2  | [See S           | <b>5P 7.1</b> ] tudent is able to refine representations and models to explain  |
| LO 3.35 | The student is able to create representation(s) that depict how cell-to-cell communication occurs by direct contact or from a  |         | seque            | the subcomponents of a biological polymer and their ence determine the properties of that polymer. [See <b>SP 1.3</b> ]   |
| LO 3.36 | distance through chemical signaling. [See SP 1.1]  The student is able to describe a model that expresses the key  | LO 4.3  | chan             | tudent is able to use models to predict and justify that ges in the subcomponents of a biological polymer affect the ionality of the molecule. [See SP 6.1, 6.4]  |
| 20 3.30 | elements of signal transduction pathways by which a signal is converted to a cellular response. [See SP 1.5]   | LO 4.4  | The s            | tudent is able to make a prediction about the interactions of ellular organelles. [See SP 6.4]  |
| LO 3.37 | The student is able to justify claims based on scientific evidence that changes in signal transduction pathways can alter cellular response. [See SP 6.1]  | LO 4.5  | evide            | tudent is able to construct explanations based on scientificence as to how interactions of subcellular structures provide tial functions. [See SP 6.2]  |
| LO 3.38 | The student is able to describe a model that expresses key elements to show how change in signal transduction can alter cellular response. [See SP 1.5]  | LO 4.6  | situat<br>struct | tudent is able to use representations and models to analyze ions qualitatively to describe how interactions of subcellular tures, which possess specialized functions, provide essential ions. [See SP 1.4] |
| LO 3.39 | The student is able to construct an explanation of how certain drugs affect signal reception and, consequently, signal transduction pathways. [See SP 6.2]   | LO 4.7  | The s            | tudent is able to refine representations to illustrate how actions between external stimuli and gene expression result ecialization of cells, tissues and organs. [See SP 1.3]                              |
| LO 3.40 | The student is able to analyze data that indicate how organisms exchange information in response to internal changes and external cues, and which can change behavior. [See SP 5.1]  | LO 4.8  | The s            | tudent is able to evaluate scientific questions concerning<br>nisms that exhibit complex properties due to the interaction<br>eir constituent parts. [See SP 3.3]   |
| LO 3.41 | The student is able to create a representation that describes how organisms exchange information in response to internal changes and external cues, and which can result in changes in behavior. [See SP 1.1]                        | LO 4.9  | The s            | tudent is able to predict the effects of a change in a connent(s) of a biological system on the functionality of an hism(s). [See SP 6.4]   |
| LO 3.42 | The student is able to describe how organisms exchange information in response to internal changes or environmental cues. [See SP 7.1]   | LO 4.10 | trate            | tudent is able to refine representations and models to illusbiocomplexity due to interactions of the constituent parts.  SP 1.3]  |
| LO 3.43 | The student is able to construct an explanation, based on scientific theories and models, about how nervous systems detect external and internal signals, transmit and integrate information, and                                    | LO 4.11 | need             | tudent is able to justify the selection of the kind of data ed to answer scientific questions about the interaction of lations within communities. [See SP 1.4, 4.1]  |
| LO 3.44 | produce responses. [See SP 6.2, 7.1]  The student is able to describe how nervous systems detect external and internal signals. [See SP 1.2]   | LO 4.12 | that o           | tudent is able to apply mathematical routines to quantities describe communities composed of populations of organisms nteract in complex ways. [See SP 2.2]   |
| LO 3.45 | The student is able to describe how nervous systems transmit information. [See SP 1.2]   | LO 4.13 |                  | tudent is able to predict the effects of a change in the comty's populations on the community. [See SP 6.4]   |
| LO 3.46 | The student is able to describe how the vertebrate brain integrates information to produce a response. [See SP 1.2]  | LO 4.14 | that o           | tudent is able to apply mathematical routines to quantities describe interactions among living systems and their environ-, which result in the movement of matter and energy.                               |
| LO 3.47 | The student is able to create a visual representation of complex nervous systems to describe/explain how these systems detect external and internal signals, transmit and integrate information, and produce responses. [See SP 1.1] | LO 4.15 | The store or sol | tudent is able to use visual representations to analyze situations ve problems qualitatively to illustrate how interactions among systems and with their environment result in the movement of              |
| LO 3.48 | The student is able to create a visual representation to describe how nervous systems detect external and internal signals. [See SP 1.1]   | LO 4.16 | The s            | er and energy. [See SP 1.4] tudent is able to predict the effects of a change of matter or gy availability on communities. [See SP 6.4]   |
| LO 3.49 | The student is able to create a visual representation to describe how nervous systems transmit information. [See SP 1.1]   | LO 4.17 | The s            | tudent is able to analyze data to identify how molecular actions affect structure and function. [See SP 5.1]  |
| LO 3.50 | The student is able to create a visual representation to describe how the vertebrate brain integrates information to produce a response. [See SP 1.1]  | LO 4.18 | how              | tudent is able to use representations and models to analyze cooperative interactions within organisms promote efficiency e use of energy and matter. [See SP 1.4]   |

| LO 4.19 | The student is able to use data analysis to refine observations and measurements regarding the effect of population interactions on patterns of species distribution and abundance. [See SP 2.2, 5.2] |
|---------|---|
| LO 4.20 | The student is able to explain how the distribution of ecosystems changes over time by identifying large-scale events that have resulted in these changes in the past. [See SP 6.2, 6.3]              |
| LO 4.21 | The student is able to predict consequences of human actions on both local and global ecosystems. [See SP 6.4]  |
| LO 4.22 | The student is able to construct explanations based on evidence of how variation in molecular units provides cells with a wider range of functions. [See SP 6.2]                                      |
| LO 4.23 | The student is able to construct explanations of the influence of environmental factors on the phenotype of an organism. [See SP 6.2]   |

| LO 4.24 | The student is able to predict the effects of a change in an environmental factor on gene expression and the resulting phenotype of an organism. [See SP 6.4]  |
|---------|--|
| LO 4.25 | The student is able to use evidence to justify a claim that a variety of phenotypic responses to a single environmental factor can result from different genotypes within the population. [See SP 6.1] |
| LO 4.26 | The student is able to use theories and models to make scientific claims and/or predictions about the effects of variation within populations on survival and fitness. [See SP 6.4]                    |
| LO 4.27 | The student is able to make scientific claims and predictions about how species diversity within an ecosystem influences ecosystem stability. [See SP 6.4]   |

## **SCIENCE PRACTICES** from the AP® Biology Curriculum Framework

- **SP 1** The student can use representations and models to communicate scientific phenomena and solve scientific problems.
- **SP 2** The student can use mathematics appropriately.
- **SP 3** The student can engage in scientific questioning to extend thinking or to guide investigations within the context of the AP® course.
- **SP 4** The student can plan and implement data collection strategies appropriate to a particular scientific question.
- **SP 5** The student can perform data analysis and evaluation of evidence.
- **SP 6** The student can work with scientific explanations and theories.
- **SP 7** The student is able to connect and relate knowledge across various scales, concepts and representations in and across domains.
